Killer whales, scientifically known as *Orcinus orca*, are the largest members of the dolphin family and are one of the top predators in the ocean. They are widely distributed in the world's oceans, from the cold Arctic waters to the warm tropical waters.

Killer whales have streamlined bodies and are mainly black and white in color, with a black back and a white belly, and a signature white patch behind the eyes, similar to a human "eye patch". They are usually between 5 and 8 meters long and can weigh several tons. Killer whales have very prominent dorsal fins, which can be as high as 1.8 meters in males, while females and calves have smaller dorsal fins.

Killer whales are very social animals, living in family units and forming complex social structures. Each family has its own unique culture and hunting techniques,

which can even be passed down from generation to generation. Killer whales are highly intelligent animals, and they use sound to communicate, including echolocation to detect prey and navigate. Killer whales have a very diverse diet, including fish, seals, sea lions, walruses, and even other whales. They are excellent cooperative hunters, able to work in teams to hunt large prey. Although killer whales have few natural predators in the wild, their numbers are affected by human activities, such as marine pollution and overfishing. Protecting killer whales and their habitats is essential to maintaining the balance of the marine ecosystem.
