No.17 Public Issue Seventeenth Butterfly Origami CP

Origami student Takayama CP origami opening number2018-03-01

Recently, Zouyou said that the CP aggregation of some angles can be seen and followed, but their children still want to learn the entry-level CP. I personally think that children can also fold works dedicated to your children!

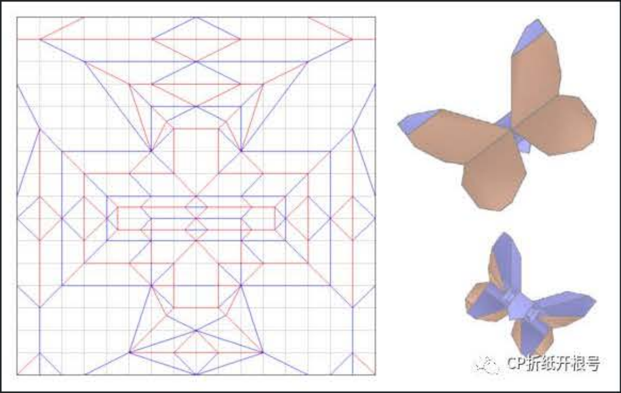
Butterfly origami has always been one of the more popular works. There are few real CPs. Now let's get to know this drawing!

16 equally divided squares.

You don't need to hit 16 equal divisions.

Except for 45 degrees, there are only 1-2 divisions, 1-3 divisions, and 3-4 divisions.

The recommended paper is 15 --- 25 cm



After a brief analysis of the drawing, go ahead and find a square, folded in a zigzag, and then divide the lines equally. I won't go into details about the line here, because children know how to operate.

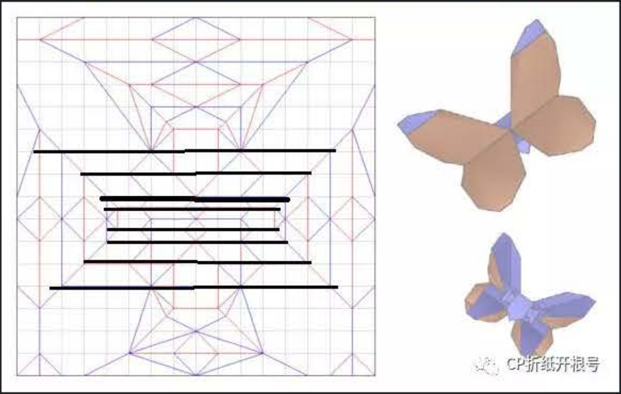
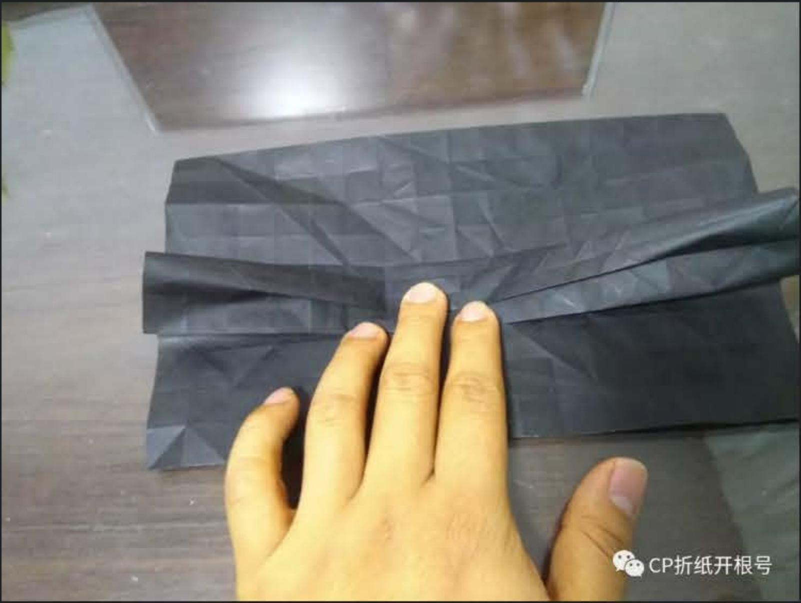
The above is the general order of wiring. But no matter which way you are, you must hit most of the lines so that we can get together.

CP折纸开根号

The first step is shown in the figure below. Fold out the horizontal line in the center according to the peaks and valleys and press the middle part.

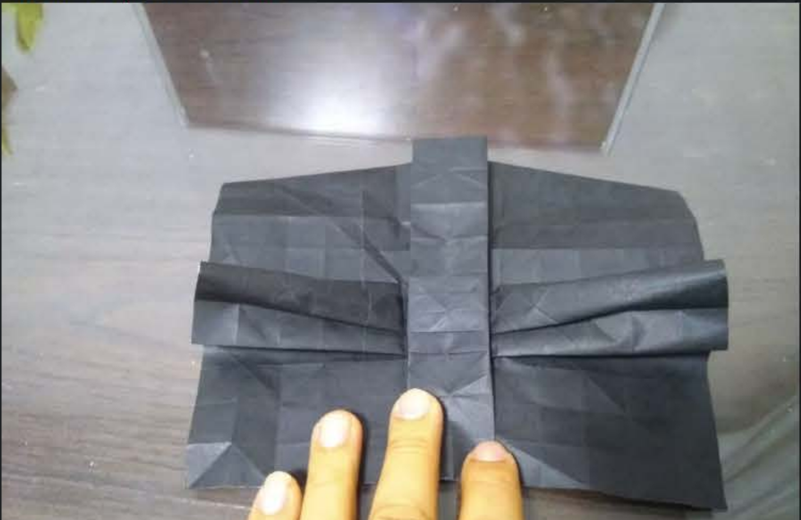


CP折纸开根号

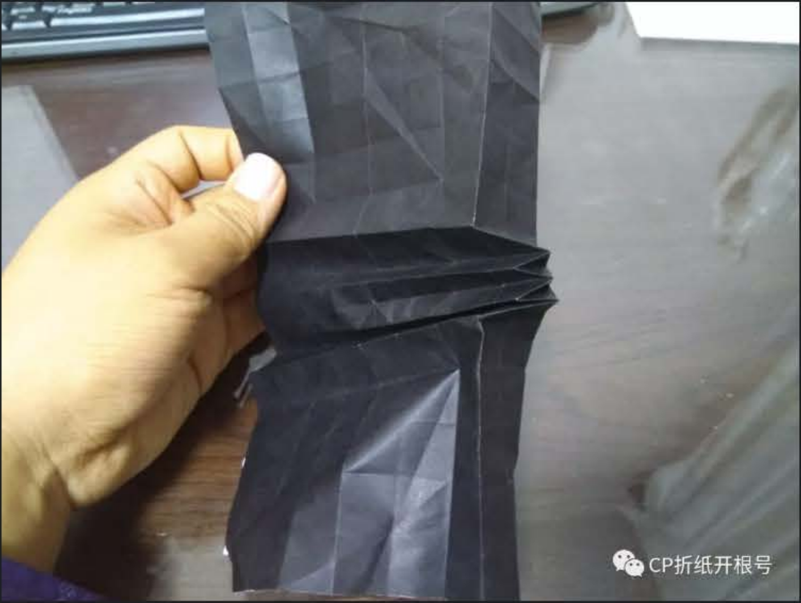


CP折纸开根号

Press the CP vertically to fold the peaks and valleys of the two lines in the center to achieve a simple lock structure



Then gently pull up the sides to begin polymerization.



Gather the left part as shown below.

The following method gathers the right side

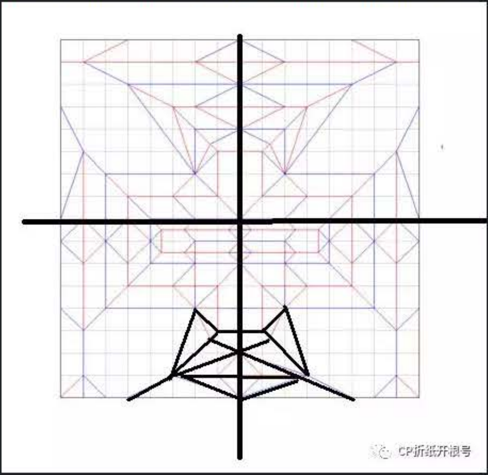
After the two sides are closed, the aggregation is started as shown in the figure below. Note the line where the peaks in the triangle intersect.



CP折纸开根号

First, pull it apart gently, and then converge according to the peak and valley.

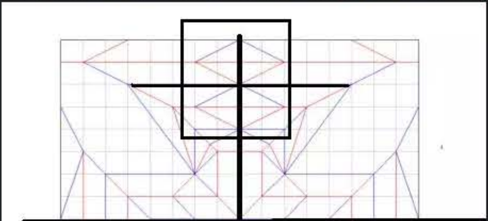
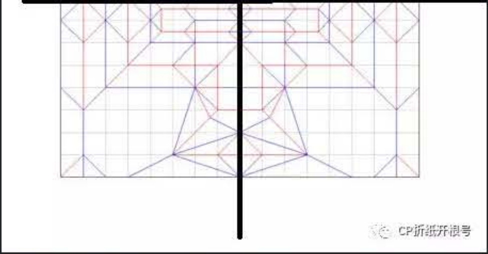
Next, we deal with the aggregation of the head. In the following figure, there are two continuous congruent graphic structures, with peaks and valleys intersected. Such a structure is caused by folding multiple layers of paper together. We can change the perspective and move the head toward our direction.





CP折纸开根号

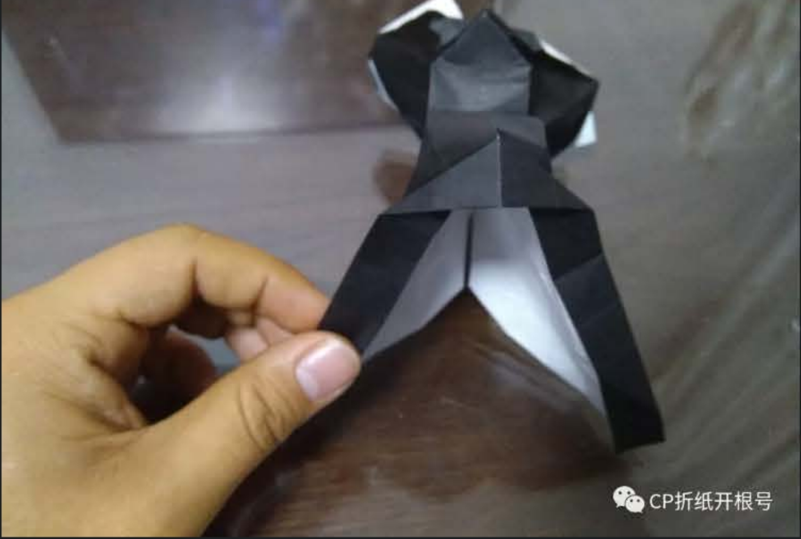
As shown below, first make a diamond structure



CP折纸开根号

Do it again.

Finally, we restored the aggregated semi-finished product to its original perspective and looked at the side.

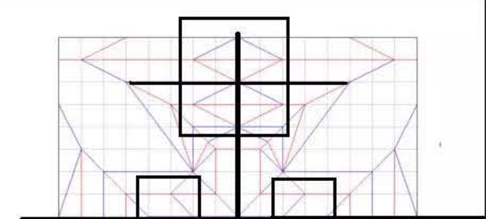
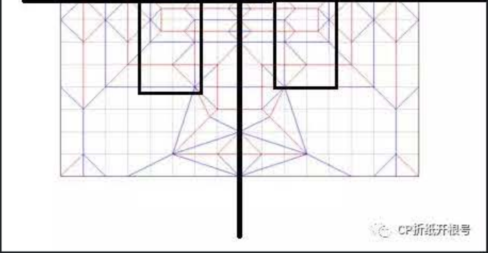
According to the figure below, we deal with the sawtooth structure in the two boxes in the last figure below. I do n't know if you have remembered the sawtooth structure mentioned in the insect and CP warming knowledge after doing so many periods There is no need to introduce too much here.





All we have to do is flatten and then make the sawtooth as simple as that.

The finished butterfly may be a bit large, but the effect of shooting with a mobile phone is relatively poor, so I dare not fold it with too small paper. It is recommended that everyone use 10-25 cm paper when folding.
