Today 's second sketch is a two-dimensional flat house from Huobao Xiaoluo. As some domestic original authors, especially two-color works, I will produce a series of his works in the future. Some of the more difficult ones will be done separately. The rest The sketch will meet you in an entry-level essay.

Let 's get to know this work. The 14 equal squares are basically taken at the intersection of 14--14, and most of the angle lines are symmetrical. Double-layer paper can be used to wire together, so the process of threading is not difficult It only takes about 25 minutes. The aggregation also starts from a long line. After the aggregation, it does not need to be shaped. Although the work does not have too many locking structures at the end, it will not spread out. Just a little glue on the house and the chimney.

Let's start the wire aggregation!

It is preferred to make the structure that forms the zigzag, because this part is relatively independent and all are long lines. It does not matter if there are short reversed lines in some places. We can pull it out and finish it.
